In another aspect, the subject invention is directed toward a method for treating microbial infections in humans or other warm-blooded animals by administering to a patient in need thereof an effective amount of a compound of Formula I or II as described above. The compound can be administered in a pharmaceutical composition either orally, parenterally or topically. Preferably the compound is administered orally or parenterally in an amount of from about 0.1 to about 100 mg/kg of body weight/day, more preferably, from about 3.0 to about 50 mg/kg of body weight/day.

## 20 Detailed Description of the Invention

The present invention discloses novel spirocyclic and fused bicyclic diazinyl and carbazinyl oxazolidinones of structural Formula I and II as described above. The compounds are useful antimicrobial agents, effective against a number of human and veterinary pathogens, particularly aerobic gram-positive bacteria, 25 including multiply-resistant staphylococci, streptococci and enterococci, as well as anaerobic organisms such as bacteroides and clostridia species, and acid-fast bacteria such as as *Mycobacterium tuberculosis* and other mycobacterial species.

The R groups are as set forth above. As used herein the term  $C_{n-m}$  is inclusive such that a compound of  $C_{1-8}$  would include compounds of one to 8 carbons 30 and their isomeric forms. The various carbon moieties are defined as follows: Alkyl refers to an aliphatic hydrocarbon radical and includes branched or unbranched forms such as methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, s-butyl, t-butyl, n-pentyl, i-pentyl, neo-pentyl, n-hexyl, i-hexyl, n-heptyl, i-heptyl and n-octyl. Acyl refers to those having one to six carbon atoms such as formyl, acetyl, propionyl, etc. 35 and their isomeric forms.

The  $R^3$  substituents are preferably both fluorine and, more preferably,

fluorine and hydrogen.

The R<sup>4</sup> substituent is preferably hydrogen, methyl, difluoromethyl, dichloromethyl, hydroxymethyl or methoxy. More preferably R<sup>4</sup> is methoxy, difluoromethyl, dichloromethyl or methyl. It is most preferred that R<sup>4</sup> is methyl.

5       The R<sup>5</sup> substituent is preferably hydroxyacetyl.

The preferred absolute configuration at C-5 of the oxazolidinone ring of compounds claimed in this invention is as represented in the structures of Formula I and II. This absolute configuration is called (S) under the Cahn-Ingold-Prelog nomenclature system. It is this (S)-enantiomer which is pharmacologically active.

10      The racemic mixture is useful in the same way and for the same purpose as the pure (S)-enantiomer; the difference is that twice as much racemic material must be used to produce the same antibacterial effect. It will be apparent to one skilled in the art that when a chiral center is present in the diazinyl or carbazinyl fragment of compounds of structural Formula I and II, then diastereomers are possible. These 15     diastereomers, in racemic and enantiomerically enriched forms, are also within the scope of the compounds of Formula I and II of the invention.

Both organic and inorganic acids can be employed to form non-toxic pharmaceutically acceptable acid addition salts of the compounds of this invention, where applicable. Illustrative acids are sulfuric, nitric, phosphoric, hydrochloric, 20     citric, acetic, lactic, tartaric, pamoic, ethanesulfonic, sulfamic, succinic, cyclohexylsulfamic, fumaric, maleic, and benzoic acid. These salts are readily prepared by methods known in the art.

Pharmaceutical compositions of this invention may be prepared by combining the compounds of Formula I or II with a solid or liquid pharmaceutically acceptable 25     carrier and, optionally, with pharmaceutically acceptable adjuvants and excipients employing standard and conventional techniques. Such pharmaceutical compositions can then be used in treating microbial infections in humans or other warm-blooded animals (patients) by various routes of administration in an effective amount or therapeutically effective amount. Typical amounts can be from about 0.1 30     to about 100 mg/kg of body weight/day, more preferably, from about 3.0 to about 50 mg/kg of body weight/day.

Solid form compositions include powders, tablets, dispersible granules, capsules, cachets and suppositories. A solid carrier can be at least one substance which may also function as a diluent, flavoring agent, solubilizer, lubricant, 35     suspending agent, binder, tablet disintegrating agent, and encapsulating agent. Inert solid carriers include magnesium carbonate, magnesium stearate, talc, sugar,

lactose, pectin, dextrin, starch, gelatin, cellulosic materials, low melting wax, cocoa butter, and the like. Liquid form compositions include solutions, suspensions and emulsions. For example, there may be provided solutions of the compounds of this invention dissolved in water and water-propylene glycol and water-polyethylene

5 glycol systems, optionally containing suitable conventional coloring agents, flavoring agents, stabilizers and thickening agents.

Preferably, the pharmaceutical composition is provided employing conventional techniques in unit dosage form containing effective or appropriate amounts of the active component, that is, the compound of Formula I according to  
10 this invention.

The quantity of active component, that is the compound of Formula I or II according to this invention, in the pharmaceutical composition and unit dosage form thereof may be varied or adjusted widely depending upon the particular application, the potency of the particular compound, the desired concentration. Generally, the  
15 quantity of active component will range between 0.5% to 90% by weight of the composition.

In therapeutic use for treating, or combatting, bacterial infections in warm-blooded animals, the compounds or pharmaceutical compositions thereof will be administered orally and/or parenterally at a dosage to obtain and maintain a  
20 concentration, that is, an amount, or blood-level of active component in the animal undergoing treatment which will be antibacterially effective. Generally, such antibacterially effective amount of dosage of active component will be in the range of about 0.1 to about 100, more preferably about 3.0 to about 50 mg/kg of body weight/day. It is to be understood that the dosages may vary depending upon the  
25 requirements of the patient, the severity of the bacterial infection being treated, and the particular compound being used. Also, it is to be understood that the initial dosage administered may be increased beyond the above upper level in order to rapidly achieve the desired blood-level or the initial dosage may be smaller than the optimum and the daily dosage may be progressively increased during the course of  
30 treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses for administration, e.g., two to four times per day.

The compounds of Formula I or II according to this invention are administered parenterally, i.e., by injection, for example, by intravenous injection or by other parenteral routes of administration. Pharmaceutical compositions for  
35 parenteral administration will generally contain a pharmaceutically acceptable amount of the compound according to Formula I or II as a soluble salt (acid

addition salt or base salt) dissolved in a pharmaceutically acceptable liquid carrier such as, for example, water-for-injection and a buffer to provide a suitably buffered isotonic solution, for example, having a pH of about 3-7. Suitable buffering agents include, for example, trisodium orthophosphate, sodium bicarbonate, sodium citrate, 5 N-methylglucamine, L(+)-lysine and L(+)-arginine to name but a few representative buffering agents. The compound according to Formula I or II generally will be dissolved in the carrier in an amount sufficient to provide a pharmaceutically acceptable injectable concentration in the range of about 1 mg/ml to about 400 mg/ml of solution. The resulting liquid pharmaceutical composition will be 10 administered so as to obtain the above-mentioned antibacterially effective amount of dosage.

A method of preparation of oxazolidinones of Formula I and II in enantiomerically pure form is depicted in Charts I-VI.

As shown in Chart I, fused bicyclic diazines and carbazines of structure 1 are 15 known in the literature. EP 0 350 733 A2. Dave, P. 25 Charts II-VI outline the synthesis of oxazolidinone antibacterial agents of structural Formula I and II from diazines or carbazines 1 and 2.

As shown in Chart II, diazine or carbazine 1 is reacted with a functionalized nitrobenzene 3 (X = halogen or trifluoromethanesulfonate) in the presence of a suitable base/solvent combination, for example dibasic potassium phosphate in 30 dimethyl sulfoxide or *N,N*-diisopropylethylamine in acetonitrile or THF, and at a suitable temperature, typically ambient temperature to 70°C, to afford the adduct 4. It will be apparent to one skilled in the art that the R<sup>1</sup> residue of compound 1 might require the presence of a suitable protecting group. For example, in the diazine case, where R<sup>1</sup> is nitrogen, the benzyl protecting group was found to be effective at 35 blocking this position. Alternatively, in the case of carbazine variants (R<sup>1</sup> =

functionalized carbon) sensitive groups such as a hydroxyl group can be protected as their *tert*-butyldimethylsilyl ethers. In the case where R<sup>1</sup> is a carbonyl, prior conversion to a ketal protects this functional group from subsequent chemical conversions. It will be apparent to those skilled in the art that these protecting groups are merely representative and that alternative protecting groups, such as those described in Greene, T. W.; Wuts, P. G. M. "Protective Groups in Organic Synthesis", 2nd ed.; John Wiley & Sons: New York, 1991, can be employed. The nitro group of 4 is then reduced by catalytic hydrogenation in the presence of a suitable catalyst, such as 10% palladium/carbon or W-2 Raney nickel, and in an appropriate solvent, for example THF/H<sub>2</sub>O. When this latter solvent system is utilized, the reaction mixture is first filtered to remove the catalyst and the filtrate containing the intermediate aniline is then treated with, for example, sodium bicarbonate and benzyl or methyl chloroformate to give the corresponding benzyl (R = CH<sub>2</sub>Ph) or methyl (R = CH<sub>3</sub>) urethane derivatives 5. When R<sup>1</sup> is a benzylamino residue, the benzyl group is lost under the hydrogenation conditions and is replaced, for example, with a Cbz group during the subsequent urethane forming reaction. The urethanes 5 are then deprotonated with a suitable base such as *n*-butyllithium (*n*-BuLi), lithium diisopropylamide (LDA) or lithium bis(trimethylsilyl)amide, in a suitable solvent such as tetrahydrofuran (THF) and at a suitable temperature such as -78 to -60°C to give a lithiated intermediate which is then treated with commercially available (-)-(R)-glycidyl butyrate. Warming to ambient temperature then directly affords the 5-(hydroxymethyl)oxazolidinones 6 in enantiomerically enriched form.

As shown in Chart III, compound 6 is then converted to the corresponding mesylate 7 (R = methyl) or aryl sulfonate 7 (R = ArSO<sub>2</sub>, for example *p*-toluenesulfonyl) by the action of, for example, methanesulfonyl chloride/pyridine or methanesulfonyl chloride/triethylamine/dichloromethane or *p*-toluenesulfonyl chloride/pyridine. The resultant sulfonate derivative 7 is then reacted with an azide source such as sodium or potassium azide in an aprotic solvent such as *N,N*-dimethylformamide (DMF) or 1-methyl-2-pyrrolidinone optionally in the presence of a catalyst such as 18-crown-6 at a temperature of 50-90 °C to afford the azide 8. The azide is then reduced by hydrogenation with palladium on carbon or a platinum catalyst in an appropriate solvent such as ethyl acetate or methanol to give the corresponding amine 9. Alternatively, the azide 8 can be reduced by treatment with a trivalent phosphorus compound such as triphenylphosphine in a suitable solvent such as tetrahydrofuran followed by the addition of water. The intermediate amine

9 may also be prepared by treatment of the phthalimide derivative 10 (obtained by reacting sulfonate 7 with potassium phthalimide in a suitable solvent, for example, acetonitrile at reflux temperature) with methylamine in ethanol/H<sub>2</sub>O at reflux temperature. Alternatively, the amine 9 may be prepared directly from the mesylate 7 by ammonolysis in a solvent system consisting of H<sub>2</sub>O/isopropanol/THF in a sealed reaction vessel immersed in a 70-95 °C oil bath. The amine 9 is then acylated by reactions known to those skilled in the art to give oxazolidinones of structure 11. For example, the amine can be reacted with an acid chloride or anhydride in a basic solvent such as pyridine at a temperature ranging from -30 to 10 30 °C to provide the acylated compound 11 (R<sup>4</sup> = optionally substituted alkyl). It will be apparent to one skilled in the art that other carbonyl groups within the scope of this invention can be readily appended to the amine 9 by standard acylation techniques, for example those highlighted in March, J. "Advanced Organic Chemistry", 3rd ed.; John Wiley & Sons: New York, 1985; p 370-375, to give 15 additional examples of 11. The oxazolidinones 11 are examples of structural Formula I, which are the subject of this invention.

As shown in Charts IV and V, selected examples of the fused bicyclic diazine and carbazine containing oxazolidinones 11, themselves antibacterial agents of structural Formula I, can be further elaborated to additional compounds of Formula 20 I.

Compound 12 (see Chart IV), efficiently obtained by catalytic hydrogenolysis of the corresponding Cbz protected derivative 11 (R<sup>1</sup> = CbzN), can be N-alkylated by procedures known to one skilled in the art, including treatment of 12 with alkyl halides or tosylates in the presence of a suitable base, to furnish compounds 13. 25 Alternatively, selected alkyl groups can be appended on the nitrogen of 12 by a reductive alkylation procedure as described in March, J. "Advanced Organic Chemistry", 4th ed.; John Wiley & Sons: New York, 1992; p 898-900. Compound 12 can also be converted to various acylated derivatives 14 by treatment of 12 with 30 various carbonyl derivatives, such as acid chlorides, anhydrides and the like, in the presence of appropriate bases, and in suitable solvents known to one skilled in the art. Similarly, sulfonamide derivatives 15 are prepared by reacting 12 with alkyl- and arylsulfonyl chlorides in the presence of suitable amine bases and in appropriate solvents known to one skilled in the art. Urethanes 16 are prepared 35 from compound 12 through the action of chloroformates and the like in the presence of appropriate bases and in suitable solvent systems known to one skilled in the art.

The above discussion should be considered merely representative in nature, since other derivatives of 12 are possible, for example the reaction of 12 with an isocyanate to give ureas 14 (R = NHY, where Y is an optionally substituted alkyl or phenyl group). Compounds 12-16 are fused bicyclic diazine examples of structural

5 Formula I, which are the subject of this invention.

Compound 17 (see Chart V), readily obtained from ketal 11 [R<sup>1</sup> = C(OCH<sub>2</sub>CH<sub>2</sub>O)] by acidic hydrolysis, for example with *p*-toluenesulfonic acid in acetone/water, can be further elaborated to additional examples of structural Formula I. For example, various hydrazone derivatives 18 can be prepared by 10 reacting 17 with hydrazines, as described in Greene, T. W.; Wuts, P. G. M. "Protective Groups in Organic Synthesis", 2nd ed.; John Wiley & Sons: New York, 1991, p 212-213 and March, J. "Advanced Organic Chemistry", 4th ed.; John Wiley & Sons: New York, 1992; p 904-905. Oximes 19 are readily prepared by reacting 17 with, for example, hydroxylamine hydrochloride or methoxylamine hydrochloride in 15 the presence of a suitable base, such as pyridine, and in an appropriate solvent, for instance methanol, at ambient temperature. Imines 20 are synthesized by treating 17 with primary amines, as described in March, J. "Advanced Organic Chemistry", 4th ed.; John Wiley & Sons: New York, 1992; p 896-897. Olefinic derivatives 21 are prepared by reacting 17 with various olefinating reagents, such as phosphorus ylides 20 and the like, which are known to one skilled in the art. Representative examples are described in March, J. "Advanced Organic Chemistry", 4th ed.; John Wiley & Sons: New York, 1992; p 956-963. The ketone moiety of 17 is amenable to further modification. Reaction of 17 with Lawesson's reagent or alternative reagents, as described in March, J. "Advanced Organic Chemistry", 4th ed.; John Wiley & Sons: 25 New York, 1992; p 893-894, provides the corresponding thioacetone 22. It will be apparent to one skilled in the art that further transformations of 17-22 are possible. For example, catalytic hydrogenation conditions or borane-based reduction methods selectively reduce the ketone, oxime and olefin moieties, respectively, of 17, 19 and 21 to give the corresponding hydroxy, amino and alkyl derivatives, respectively. 30 Compound 17 can also be converted to corresponding cyclic and acyclic ketals and dithio ketals by reacting 17 with diols, dithiols, alcohols or thiols under conditions, for example, described in Greene, T. W.; Wuts, P. G. M. "Protective Groups in Organic Synthesis", 2nd ed.; John Wiley & Sons: New York, 1991, p 177-207. Compounds 17-22 and the above described derivatives represent examples of fused 35 bicyclic carbazine oxazolidinone antibacterial agents, which are the subject of this

invention.

It will be apparent to those skilled in the art that the described synthetic procedures for making fused bicyclic diazinyl and carbazinyloxadiazolidinone antibacterial agents are merely representative in nature and that alternative 5 synthetic processes are known, for example some of those described in the cited references. It will also be apparent to those skilled in the art that the outlined synthetic process, with non-essential variations, is readily adaptable to the preparation of spirocyclic diazinyl and carbazinyloxadiazolidinone antibacterial agents of structural Formula II, which are also the subject of this invention (see Chart VI).

Step 1:

(±)-*cis*-2,8-diazabicyclo[4.3.0]nonane (24.6 mmol) was dissolved into 30 mL of dry DMSO. The solution was treated with K<sub>2</sub>HPO<sub>4</sub> (8.6 g, 49.2 mmol) followed by 3,4-difluoronitrobenzene (3.9 g, 24.6 mmol). The mixture became a bright orange color. The mixture was stirred for 20 hours at ambient temperature under N<sub>2</sub>. After this time the mixture was poured into a separatory funnel along with CHCl<sub>3</sub>. The solution was washed with H<sub>2</sub>O and brine. The organic phase was separated and dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. The solution was filtered and concentrated to give an orange oil that was purified by chromatography on silica gel eluting with a gradient of 1-5% MeOH/CHCl<sub>3</sub>. This gave 4.2 g of product as an orange waxy solid. MP: 77-79°C.

Step 2:

30 The nitro aromatic product obtained in Step 1 (1.5 g, 5.65 mmol) was dissolved into 50 mL of THF. The solution was treated with the catalyst 10% Pd/C under a stream of N<sub>2</sub>. The mixture was degassed by evacuation and flushing with N<sub>2</sub> (3 times), followed by evacuation and flush with H<sub>2</sub> (3 times). The mixture was maintained at 35 psi of H<sub>2</sub> and was shaken on the parr. After 4 hours of reaction 35 time TLC showed starting material was consumed. This solution was diluted with 50 mL of 1:1 acetone/H<sub>2</sub>O and the mixture was cooled to 0°C. The reaction mixture

was treated with solid NaHCO<sub>3</sub> (1.4 g, 17.0 mmol) followed by benzyl chloroformate (2.0 g, 11.9 mmol). This mixture was left to stir overnight with warming to room temperature. After 16 hours the reaction mixture was diluted with CH<sub>2</sub>Cl<sub>2</sub> and filtered through celite. The filtrate was poured into a separatory funnel along with H<sub>2</sub>O. The mixture was shaken and the organic phase was separated, washed with brine followed by drying over anhydrous Na<sub>2</sub>SO<sub>4</sub>. The solution was filtered and concentrated to give a solid that was purified by chromatography on silica gel eluting with 5:1 hexane/EtOAc. Isolated 2.0 g of U-141248 as a yellow solid. This material was recrystallized from 10% EtOAc/hexane to give a white solid. MP: 139-140°C.

Step 3:

The product of Step 2 (505 mg, 1.00 mmol) was dissolved into 10 mL of dry THF and the solution was cooled to -78°C. The solution was treated with *n*-BuLi (1.6 M soln. in hexanes; Aldrich; 656 µL, 1.05 mmol) via syringe. After 10 minutes (R)-glycidyl butyrate (151 mg, 1.05 mmol) was added and the mixture was left to stir overnight with warming to room temperature. After 14 hours the mixture was examined by TLC which showed the starting material was consumed. The reaction was poured into a separatory funnel along with EtOAc. The mixture was washed with saturated aqueous NH<sub>4</sub>Cl and brine. The organic phase was separated and dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. Filtered and concentrated to give a residue that was purified by radial chromatography eluting with a gradient of 1-3% MeOH/CHCl<sub>3</sub>. Isolated 294 mg of 5-(hydroxymethyl)oxazolidinone intermediate as a tan foam. MP: 71-73°C.

Step 4:

The alcohol obtained in Step 3 (880 mg, 1.90 mmol) was dissolved into 15 mL of dry CH<sub>2</sub>Cl<sub>2</sub> and the solution was cooled to 0°C. The solution was treated with Et<sub>3</sub>N (336 mg, 3.32 mmol) and stirred for 5 minutes. Next solid 3-nitrobenzenesulfonyl chloride (NosylCl, 561 mg, 2.53 mmol) was added and the mixture was stored in the freezer overnight. After 15 hours TLC showed the starting alcohol was consumed with the formation of a new higher R<sub>f</sub> product. The reaction was poured into a separatory funnel along with CH<sub>2</sub>Cl<sub>2</sub>. The solution was washed with 1.0 N aqueous HCl and saturated sodium bicarbonate. The organic phase was separated and dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. Filtered and concentrated to give 1.3 g of the nosylate as an orange foam. This material was used without purification.

**Step 5:**

The crude nosylate (1.9 mmol) was dissolved into 10 mL of CH<sub>3</sub>CN and the solution was transferred to a resealable tube. The solution was diluted with 5 mL of isopropanol and 10 mL of 28% aqueous NH<sub>4</sub>OH. The tube was sealed and heated to 5 65°C. After 15 hours the solution was cooled to ambient temperature and TLC showed that the nosylate was consumed. The reaction was poured into a separatory funnel along with CH<sub>2</sub>Cl<sub>2</sub>. The solution was washed with saturated aqueous NaHCO<sub>3</sub> and brine. The organic phase was separated and dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. Filtered and concentrated to give the crude amine as a foam. This 10 material was dissolved into 20 mL of dry CH<sub>2</sub>Cl<sub>2</sub> and the solution was cooled to 0°C. The reaction was treated with 500 µL of dry pyridine along with an excess of Ac<sub>2</sub>O (200 µL). This mixture was left to stir overnight with warming to room 15 temperature. After 18 hours the reaction mixture was poured into a separatory funnel along with CH<sub>2</sub>Cl<sub>2</sub>. The solution was washed with 1.0 N aqueous HCl and saturated aqueous NaHCO<sub>3</sub>. The organic phase was separated and dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. The solution was filtered and concentrated to give a tan foam 20 that was purified on silica gel by radial chromatography eluting with 3% MeOH/CHCl<sub>3</sub>. This provided 776 mg of the title compound as a tan foam (mixture of diastereomers). MP: 74-76°C. HRMS (EI) calcd for C<sub>27</sub>H<sub>31</sub>FN<sub>4</sub>O<sub>5</sub> 510.2278, found 510.2278.

**EXAMPLE 11: (S)-N-[3-[3-fluoro-4-[*cis*-2-(carbomethoxy)-2,8-diazabicyclo[4.3.0]nonan-8-yl]phenyl]-2-oxo-5-oxazolidinyl]methylacetamide****Step 1:**

25 The starting material, EXAMPLE 10, (850 mg, 1.7 mmol) was dissolved into 20 mL of MeOH. The solution was treated with the catalyst 10% Pd/C (85 mg) under a stream of N<sub>2</sub>. The parr bottle was evacuated and flushed with N<sub>2</sub> (3 times) followed by evacuation and flushed with H<sub>2</sub> (3 times). The mixture was maintained at 35 psi of H<sub>2</sub> pressure and was shaken on the parr. After 10 hours of reaction 30 time TLC showed starting material was consumed. The solution was filtered through celite and the filtrate was concentrated under reduced pressure to give 585 mg of a tan foam. This crude amine was used without purification.

**Step 2:**

35 The crude amine (380 mg, 1.01 mmol) was dissolved into 2:1 acetone/H<sub>2</sub>O and the solution was cooled to 0°C. Solid NaHCO<sub>3</sub> (170 mg, 2.02 mmol) was added

along with methyl chloroformate (119 mg, 1.26 mmol). The mixture was left to stir overnight with warming to room temperature. After 16 hours the reaction mixture was poured into a separatory funnel along with CH<sub>2</sub>Cl<sub>2</sub>. The mixture was washed with H<sub>2</sub>O and brine. The organic phase was separated and dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. The solution was filtered and concentrated to give a white foam that was purified by radial chromatography eluting with 20% CH<sub>3</sub>CN/CHCl<sub>3</sub>. This gave 367 mg of the title compound as a white foam (mixture of diastereomers). MP: 83-85°C. HRMS (EI) calcd for C<sub>21</sub>H<sub>27</sub>FN<sub>4</sub>O<sub>5</sub> 434.1965, found 434.1971.

10 EXAMPLE 12: (S)-N-[3-[3-fluoro-4-[cis-2-(acetoxycetyl)-2,8-diazabicyclo[4.3.0]nonan-8-yl]phenyl]-2-oxo-5-oxazolidinyl]methylacetamide

Step 1:

The crude amine intermediate described in EXAMPLE 11, Step 1, (500 mg, 1.33 mmol) was dissolved into 10 mL of dry CH<sub>2</sub>Cl<sub>2</sub>. The solution was cooled to 0°C and treated with 1.0 mL of dry pyridine followed by acetoxyacetyl chloride (218 mg, 1.59 mmol). This mixture was left to stir overnight with warming to room temperature. After 18 hours TLC showed starting material was consumed. The reaction mixture was poured into a separatory funnel along with CH<sub>2</sub>Cl<sub>2</sub>. The solution was washed with 0.5 N aqueous HCl, saturated aqueous NaHCO<sub>3</sub> and brine. The organic phase was separated and dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. Filtered and concentrated to give a gum that was purified by radial chromatography eluting with 10% CH<sub>3</sub>CN/2% MeOH/CHCl<sub>3</sub>. This gave 426 mg of the title compound as a white foamy solid (mixture of diastereomers). MP: 113-116°C. HRMS (EI) calcd for C<sub>23</sub>H<sub>29</sub>FN<sub>4</sub>O<sub>6</sub> 476.2071, found 476.2065.

25 EXAMPLE 13: (S)-N-[3-[3-fluoro-4-[cis-2-(hydroxyacetyl)-2,8-diazabicyclo[4.3.0]nonan-8-yl]phenyl]-2-oxo-5-oxazolidinyl]methylacetamide

Step 1:

The starting material, EXAMPLE 12, (325 mg, 0.68 mmol) was dissolved into 6 mL of MeOH. The solution was cooled to 0°C under N<sub>2</sub>. The solution was treated with 3.0 mL of 10% aqueous K<sub>2</sub>CO<sub>3</sub>. The mixture was stirred for 2 hours. After this time TLC showed U-141950 was consumed. The reaction was quenched with 1.0 N aqueous HCl to pH 6.5 (litmus). The reaction mixture was poured into a separatory funnel along with CH<sub>2</sub>Cl<sub>2</sub>. The solution was washed with H<sub>2</sub>O and brine. The organic phase was separated and dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>. Filtered and concentrated to give 276 mg of the title compound as a white foam

(mixture of diastereomers). MP: 102-110°C.

HRMS (EI) calcd for C<sub>21</sub>H<sub>27</sub>FN<sub>4</sub>O<sub>5</sub> 434.1965, found 434.1975.
